

GOALRUSH 2D

HTML5 Canvas Football Game

I built this as an individual browser game project, focusing on a playable match loop, clean game menus, character selection, audio settings, score tracking, and a simple AI opponent.

Project report and UI screenshots

Documentation, structure, features, and gameplay screens

What I Built

GoalRush 2D is a single-player 2D football game that runs directly in the browser. I kept the project lightweight and focused on the complete user flow from launch screen to match over screen.

Main idea

The game is designed around a quick three-minute match. The player moves, jumps, kicks the ball, and uses limited special shots while an opponent reacts to the ball and tries to defend or counter.

What the repo includes

Launch and main menu flow

A polished start screen, menu buttons, settings, scores, and credits.

Canvas gameplay

Player, opponent, ball physics, goals, match timer, and scoreboard.

Persistent preferences

High score, saved scores, selected characters, and volume settings using localStorage.

Media assets

Player sprites, ball image, field images, music, and sound effects.

Game Features

This page summarizes the main things I implemented and why they matter for the player experience.

Match loop

Three-minute match timer, kickoff reset, goals, replay, and match over screen.

Player controls

Arrow movement, jump, kick, pause, and limited special shots for stronger attacks.

Opponent behavior

A simple AI opponent tracks the ball, jumps near headers, and reacts when the player pushes forward.

Menus and panels

Launch screen, main menu, settings modal, character selection, high scores, pause, and credits.

Audio

Menu music, launch music, match music, crowd ambience, kick effects, goal effects, and volume sliders.

Saved data

LocalStorage keeps selected characters, volume preferences, high score, and recent score list.

How the Project Is Organized

The project is intentionally simple: no build step, no framework, and no server requirement. It can be opened directly in a browser.

Folder structure

javascript-football-game/

index.html

style.css

game.js

resources/

images, sprites, music, sound effects

docs/

Project documentation PDF

Implementation notes

index.html

Defines the screens, panels, canvas, scoreboard, controls, and menu layout.

style.css

Handles the full visual layer: launch page, panels, responsive layout, scoreboard, and match screen.

game.js

Runs the game loop, input handling, collision logic, scoring, AI movement, audio, settings, and localStorage.

resources/

Keeps all media files local so the game can load without depending on remote images.

Controls and Player Flow

The controls are short enough to learn quickly, but the match still has movement, timing, and special-shot decisions.

Controls

Left / Right

Move player

Up

Jump

D

Kick

Space or Q

Special shot

Esc

Pause match

Enter

Open menu / restart match

Flow

1. Launch screen introduces the game and opens the main menu.
2. Main menu gives access to match start, settings, character selection, high scores, and credits.
3. Match screen runs the canvas gameplay with timer, scores, special-shot count, and high-score display.
4. Pause and match-over panels let the player resume, replay, or return to the menu.

Launch and Menu

The first screens set up the game identity and route the player into the main actions.

Launch screen

Main menu

Panels

Settings, character selection, scores, and credits are handled as modal-style panels over the menu.

Audio settings

Character selection

High scores

Credits panel

Match Screen

The canvas match view combines the game field, scoreboard, timer, high-score card, and quick control hints.

Kickoff and scoreboard

Live match play

Current Status and Next Improvements

The game is playable as a static browser project. The repo now includes a clean README, documentation PDF, UI screenshots, and a small set of app polish fixes.

Current status

GoalRush 2D has the core browser game flow working: launch, menu, character selection, settings, match play, pause, match over, and saved score data.

Future ideas

- Add difficulty selection to the settings panel.
- Add touch controls for mobile play.
- Separate image and audio assets into named subfolders when the asset list grows.
- Add a small automated browser smoke test for launch and menu screens.
